TEAM INFORMATION

Safe Edge.

We help SDP's park teams find, fix and prove the gaps at township water edges.

1. THE PROBLEM

Storms break fences.
Nobody walks every edge.

Bandar Mahkota Cheras · 1 May 2026: nine-year-old girl swept away, found 10 km away. Kajang · 4 Dec 2025: two brothers swept away, neither survived.

371

child and teen drowning deaths in Malaysia, Jan 2023 to Aug 2026

Bomba, in The Star, 16 Oct 2026

8 of 21

reported township water incidents began in a drain

Our news-report table, 2023-2026; not a rate

> **“The bigger issue is … clear accountability for maintenance and public safety.”**
>
> Mr. Eric, former Head of Township, Sime Darby Property · 16 Oct 2026

2. TARGET USER

One manager.
Every edge closed.

WHO WE BUILT IT FOR

SDP's Elmina park maintenance manager

Keeps every retained water edge closed, and knows which ones are not.

- No record of where the fences are
- A weekly walk misses last night's storm
- A finished repair can leave a way round the fence end

Works with the drainage engineer, an independent reviewer and the township GM; roles to confirm with SDP

3. YOUR SOLUTION

Safe Edge: find it, fix it, prove it.

Find

A drone or the walk crew's phone spots the change. A named owner confirms it.

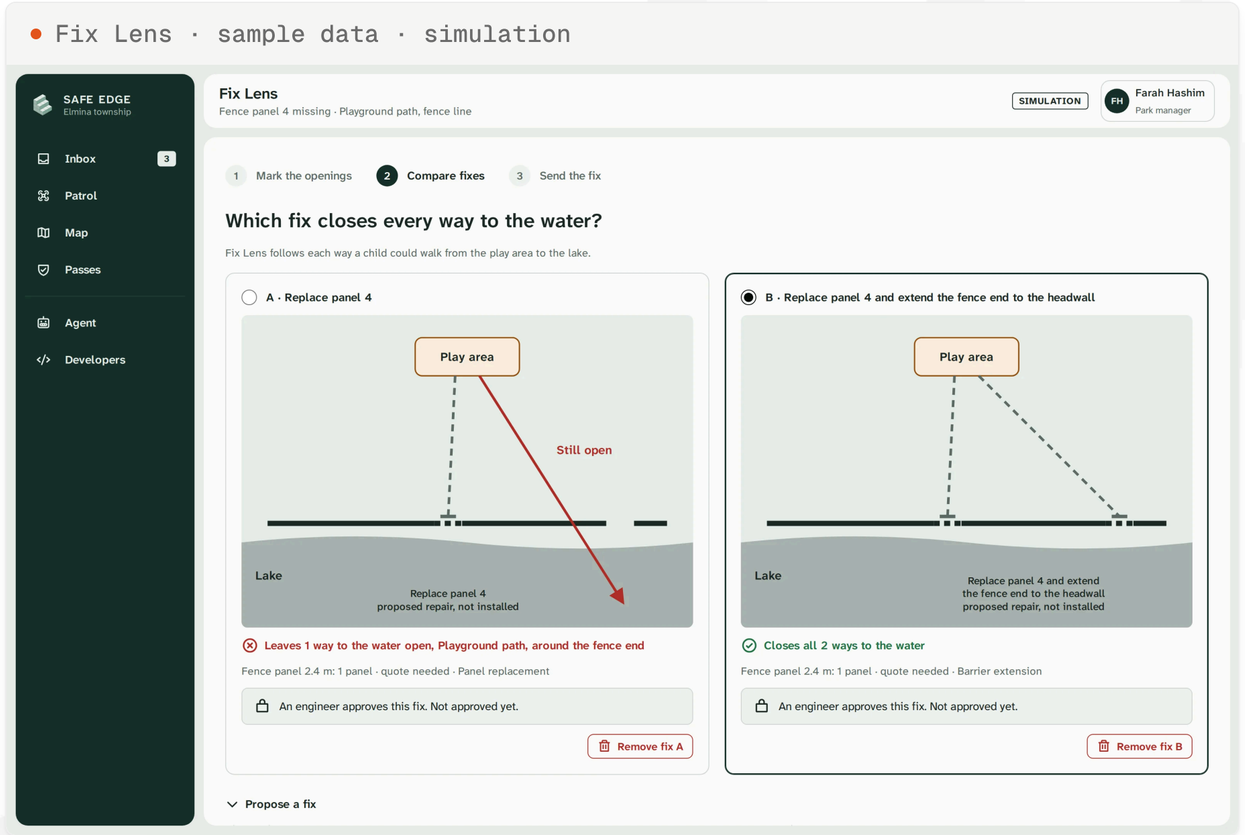

Fix

Fix Lens tests if a repair closes every way to the water, before anyone pays.

Prove

Someone who didn't install it checks on site. The edge's pass expires.

4. INNOVATION

The drone is optional. The proof is the product.

Flag → **Named owner** → **Fix Lens** → **Independent proof** → **Expiry**

Flag
AI flags; pass suspends

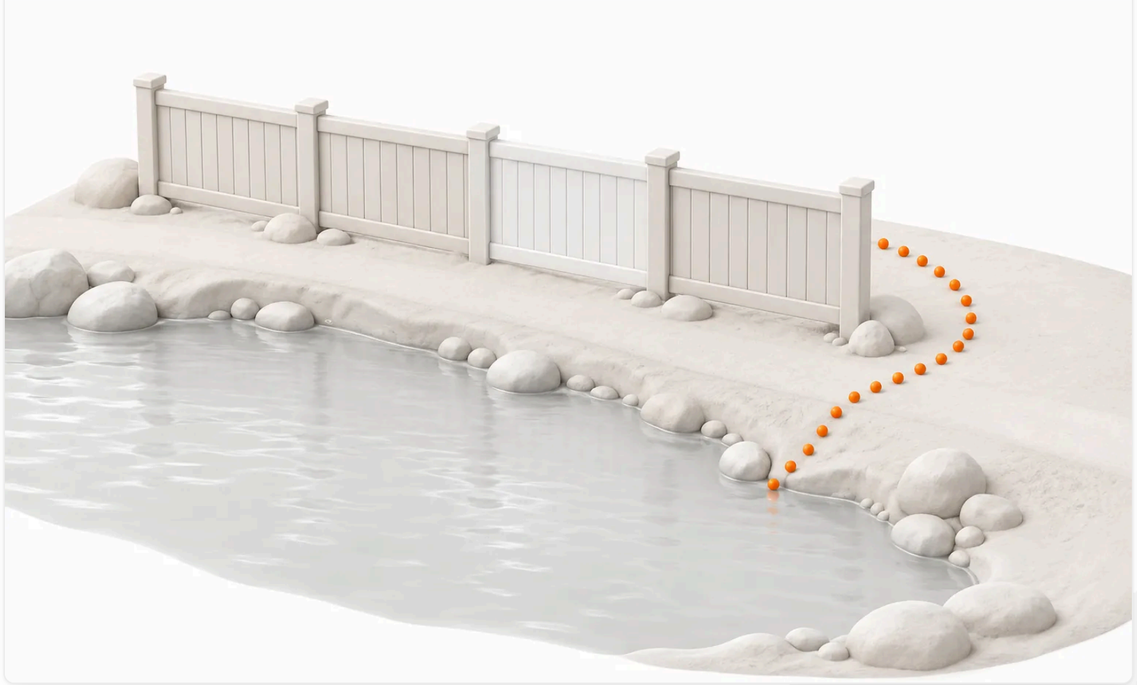

Named owner
A person confirms

Fix Lens
Every route closed?

Independent proof
Not the installer

Expiry
Checked again

A new panel, and still a way round

ALREADY EXISTS

Drone inspection and AI change detection: Singapore's Public Utilities Board, DJI FlightHub 2.

Missing: a repair isn't done until every route is shut and someone else checks.

OUR RULE

AI flags. People decide. No model approves.

Fix Lens: people mark each opening and each way to the water; a fix counts only if every way is blocked. Plain rules an engineer can check. Demo detection is simulated.

5. HOW IT WORKS

Six steps. Only people decide.

01

Patrol

A drone or the walk crew covers each edge

DRONE OR PHONE

02

Flag

A missing safety item suspends the pass

AI OR PATROL

03

Confirm

The manager decides in the Edge Inbox

PARK MANAGER

04

Fix

Fix Lens checks the repair closes every route

MANAGER AND ENGINEER

05

Prove

Someone who didn't install it re-tests on site

ANOTHER PERSON

06

Repeat

The pass expires; the next patrol checks again

SAFE EDGE

Unknown is never shown as safe

Safe Edge

6. IMPACT

Count the open routes. Keep them closed.

MAIN MEASURE

Day 30

Confirmed open routes to the water still closed 30 days after the repair.

Target: all of them.

Counted on site before the repair; reported with raw counts

SPEED

< 48 h

from flag to interim protection (pilot target)

Today: up to 7 days between weekly walks

WHO GAINS

Both

Families: tested edges. **SDP:** a record for the council.

"…preserve community trust and township value": former SDP Head of Township

ACCESS

Open

The park stays usable. Closing it never counts as a fix.

It measures the hazard, not drownings.

SDP fit People · Safety & security. SDP already inspects its drains (IAR 2025); Safe Edge makes each check provable.

Sources: SDP Integrated Annual Report 2025; Sustainability Report 2025, pp. 94-95

Safe Edge

7. FEASIBILITY

It starts without a drone.

SOFTWARE

Built

Web app, API, SDK and MCP server, tested end to end

Not yet a field trial

STARTS NOW

Phone

The walk crew runs the loop with no aviation approval

Needs SDP's written access

PILOT CEILING

RM10k

for one asset; RM5,000 of it is the repair

Our ceiling, not a quote · phone-first, no drone cost · repeats across SDP's 27 townships

DRONES LATER

~2 mo

of CAAM, JUPEM, MBSA and privacy approvals, priced on top

Inside Subang's control zone; our estimate

Owner park manager · **Approves** drainage engineer · **Re-tests** independent reviewer · **Funds** township GM

8. IMPLEMENTATION

One drain. Eight weeks. A gate to scale.

BEFORE WORK	**Entry gate**	Written access, a named owner and engineer, a quote, funds
WEEKS 1-2	**Baseline**	Count every route. Fix Lens against today's method
WEEKS 3-8	**Fix and prove**	Interim protection, the repair, an independent re-test
DAY 30	**Check again**	Routes still closed? Park still usable?
DECISION	**Scale gate**	Scale only if closure, access, cost and ownership hold; drop the app claim if no better repair or time saved

One retained drain, Elmina Central Park · RM10,000 ceiling · proposed; SDP has not committed

Safe Edge

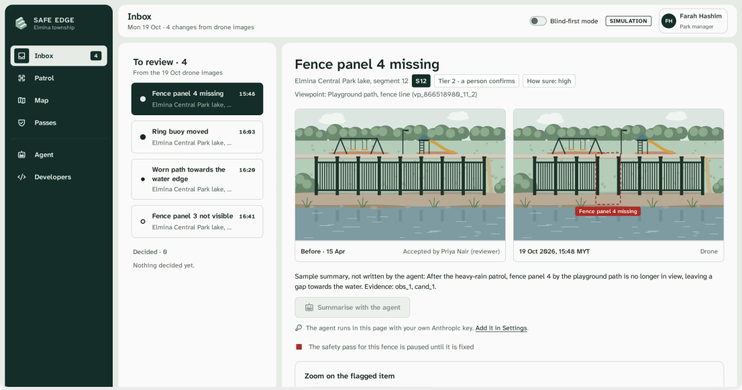

9. VISUAL CONCEPT

The working prototype, step by step.

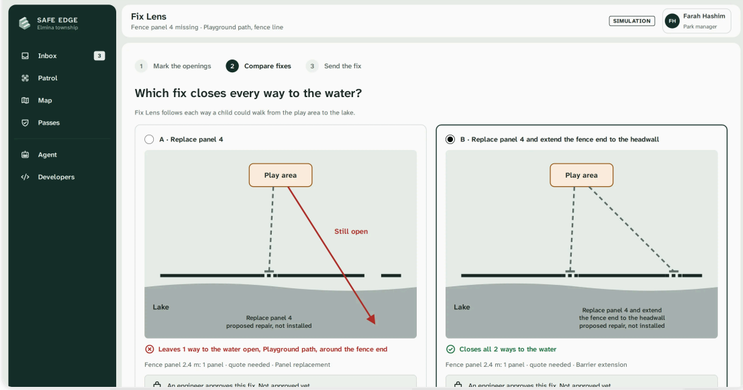

1 Find · 3D Elmina scene · simulation

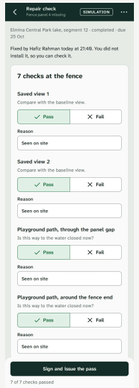

2 Confirm · Edge Inbox

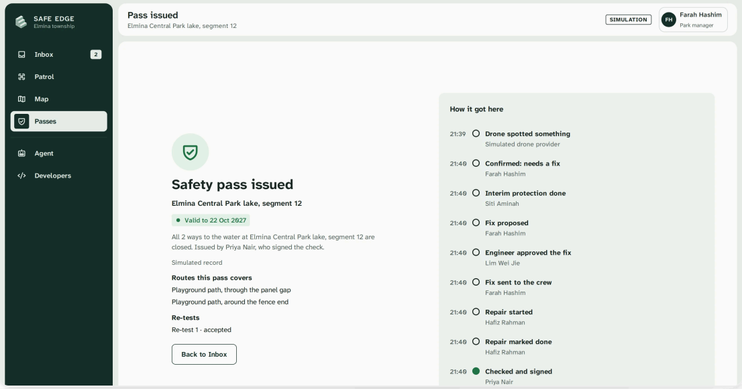

3 Fix · Fix Lens

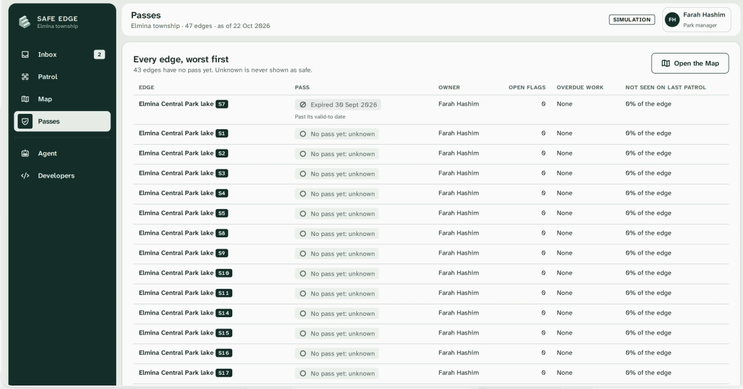

4 Prove · phone re-test

5 Pass · the record

6 Board · every edge, worst first

Live demo · safe-edge-two.vercel.app

10. WHY YOUR TEAM SHOULD WIN

We've shipped before. This one runs today.

- Three computer science and law students
- Between us: Grand Champion, Project 2030 MyAI Future Hackathon (Layak); Champion, URIIS 2026 (MyTakziah)
- Every one of us has shipped to production, with real users
- Safe Edge runs end to end; Fix Lens catches the repair that leaves a way round

OUR ASK

An eight-week pilot on one retained drain in Elmina Central Park

A named owner · a RM10,000 ceiling

See it for yourself.
